This tutorial is meant to help the reader understand how to remove movement capabilities from the player so they can be given back to the player through pickups (or just removed forever)
All of this is changing fields in the Inspector, no code experience needed

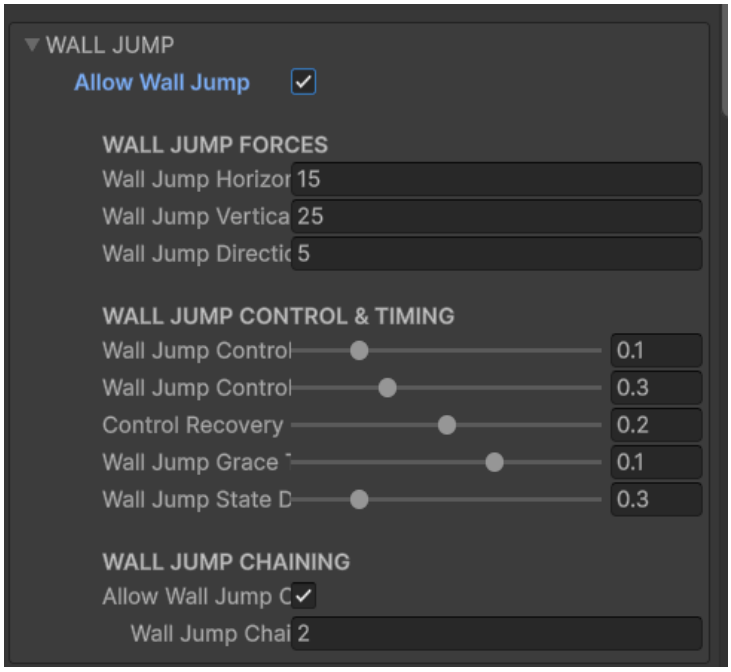

All of this is editing fields on this component, Player Movement.
First, let's remove the player's advanced movement abilities.

Press this button to navigate to the advanced movement section of player movement.

Wall Jump

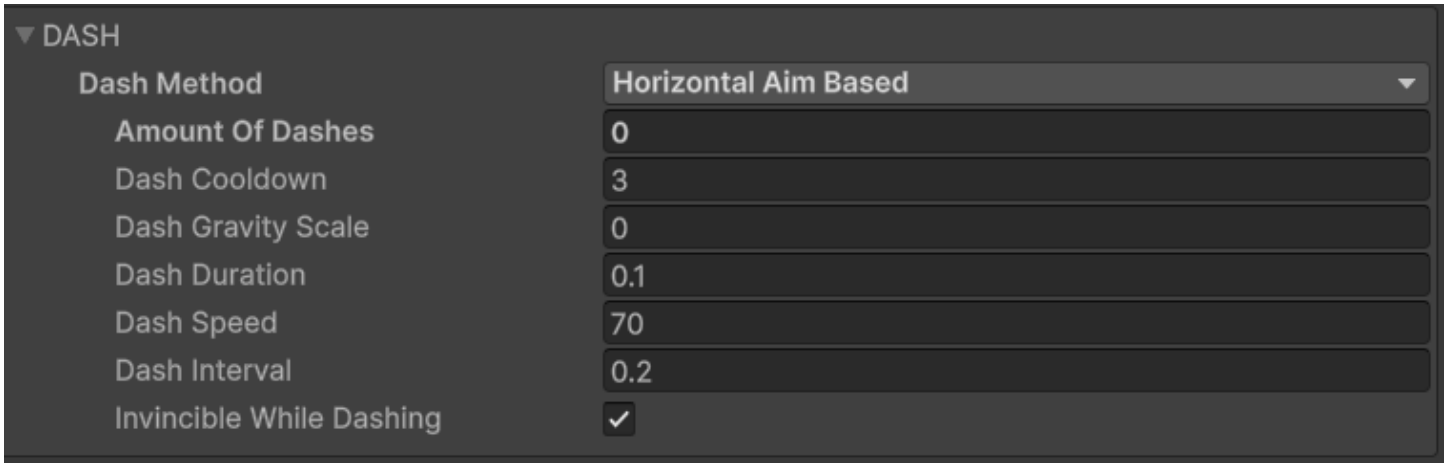

First up, Wall Jump. The main thing you can do is to just fully turn it off by unchecking “Allow Wall Jump”.

Wall Slide

Next, Wall Slide. Similar to Wall Jump, the main thing you can do is turn it off by unchecking the “Allow Slide” checkbox. You could also make it so the player must press a horizontal direction to wall slide by checking “Require Horizontal Input to Slide” (it’s cut off in this screenshot, it’s the box just under allow slide) You can also make it so Wall Sliding does not reset jumps by unchecking “Wall Sliding Resets Jumps”.

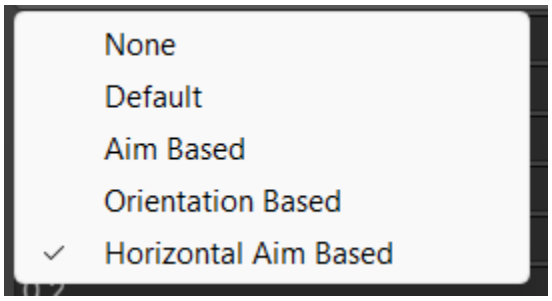

Dash

Now for dash, there are a few things you can do. There are a few Dash Modes that can restrict dash capabilities. You can also control the amount of dashes the player can have & the time it takes for them to regain their dashes & also tweak the other characteristics of the dash (I've found these settings feel the best to me)

There are two ways you can turn off the player's ability to dash. You can either set the Amount of Dashes to 0 or set the Dash Method to None

Speaking of Dash Modes, here's a quick breakdown of those.

None disables the dash.

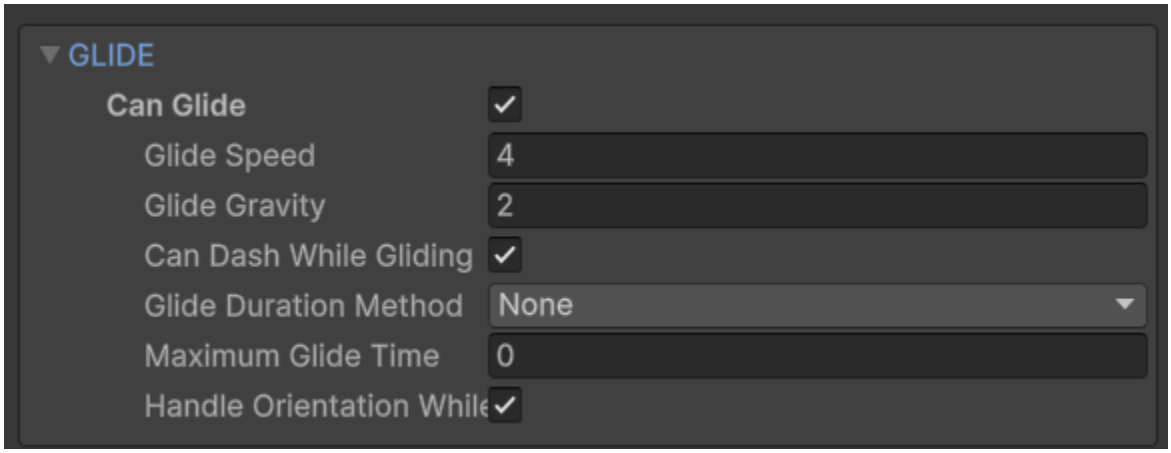

Default is the same as Orientation Based.

Aim Based dashes directly toward the cursor.

Orientation Based dashes horizontally in the direction the player is facing.

Horizontal Aim Based dashes horizontally in the relative direction of the cursor.

Glide

Glide is another simple one. You can turn it off completely with “Can Glide” or just make it so the player cannot dash while gliding with “Can Dash While Gliding”.
